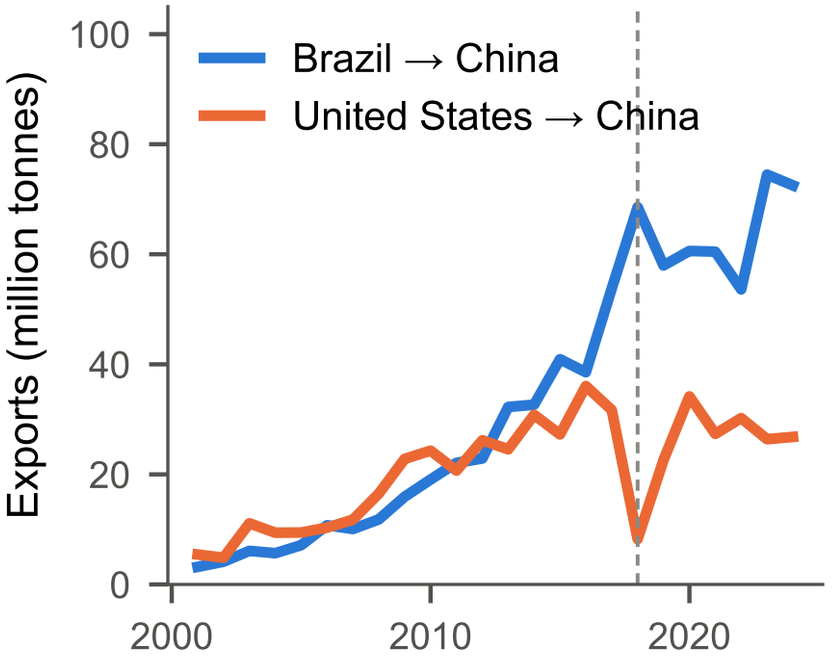
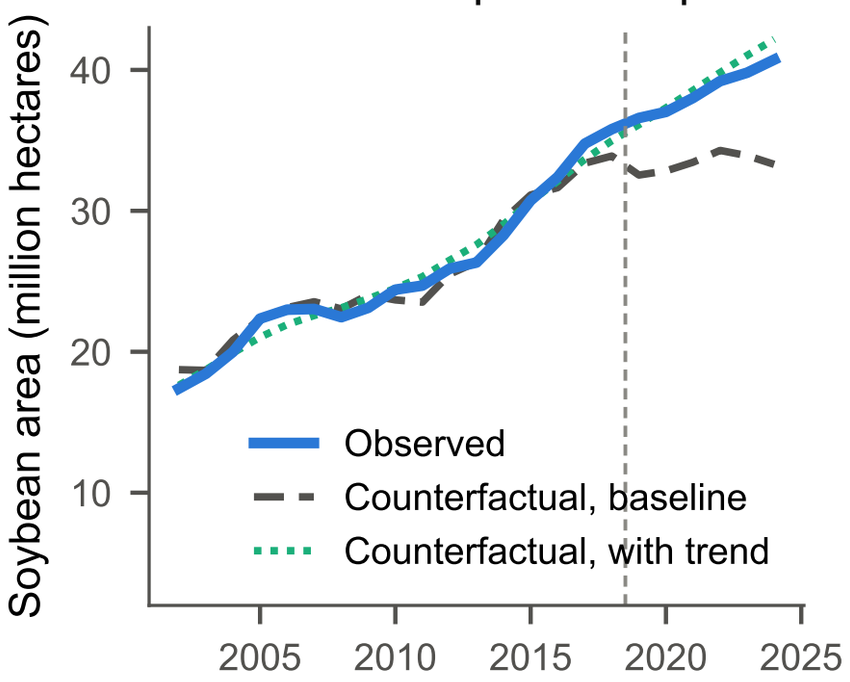
United States–China tariff dispute and Brazilian soybean expansion

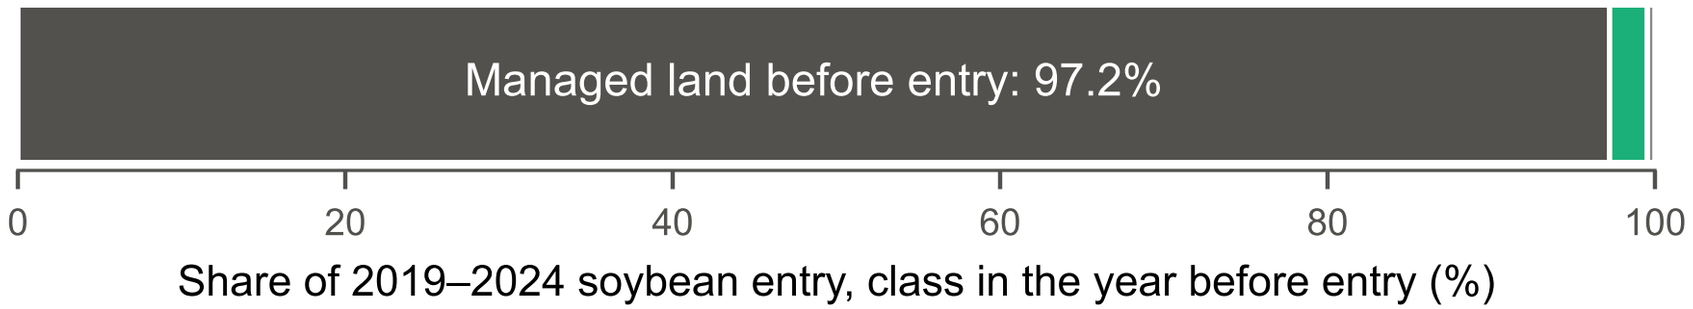
1 Trade shifted to Brazil



2 Area kept growing; no robust excess over pre-2018 path



3 Land before soybean



- 6.1% had native vegetation within 5 years (0.56 million hectares), including at least 3.4% that went native → managed → soybean
- Native vegetation includes savanna and grassland, not only forest
- Shifts in location and pasture displacement are not measured
- Forest loss is neither attributed to the tariff nor ruled out
